

## **Freedom: Individual configurable data interfaces**

*Background: most data collection applications in production (data capturing), machine data or time attendance indicates fixed interfaces for data processing. The user can choose between the from the supplier offered data formats and has normally no easy reaching possibility to get the data into his / her favourite format.*

We do not like this static way of data processing:

**For maxium freedom in data processing of industrial data capturing / production data / time attendance ... we are offering our applications with a user configurable data format. Even if SQL database, ASCII / text, XML or for easy using in Office / Excel - the user can configure his / her favourite data format directly inside the terminal system.**

We supports a modern way of configuration technique, there are normally no programming knowledge needed to change the data format inside the terminal application. A wide range of data formats are given inside various sample software.

The user gets the advantage to hold an universal usable system. He can change the data format anytime and everywhere. Even and of course if the IT environment growth - the modern configurable terminal software will growth with the customer also!
